

Eurotherm Ltd – Notice of Improvements

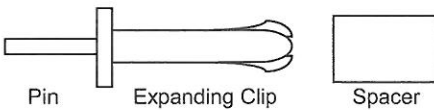

This note refers to changes to Eurotherm instruments 2204e and 2208e - Communication module fastening clip.

The support pillar that secures the communication module to the power supply board in the above instruments has been replaced in order to provide better support and reduce the possibility of connector damage.

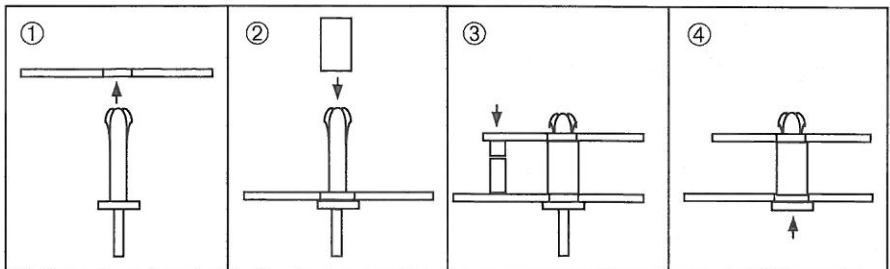

The new pin fastener design requires a larger mounting hole and is not compatible with the old PCBs designed for the clip. Both fasteners are included in the pack to enable fitting to all instruments.

New Expanding Clip Installation Instructions

If this clip is being used as a service replacement, discard the old clip.

- ① Push the fastener through the hole in the Power Supply Board from the bottom side
- ② Slide the spacer over the end of the fastener
- ③ Connect the communication PCB onto the Power Supply board, making sure that the connector is correctly aligned
- ④ With the assembly on a flat surface, hold securely, and press the pin into position until the top of the pin is flush with the body
